

BLACKBLOT METHODOLOGY ADD-ON FOR QPACK™

PRODUCT DESCRIPTION

The “Blackblot Methodology Add-On for QPack™” is a software solution to write and manage market requirements using the QPack product development lifecycle management software application.

This add-on is aimed at helping product planners create true and clear Market Requirements Documents (MRD) which are later used to generate product requirements and technical specifications; while providing an easy way to instill traceability between all these elements. The “Blackblot Methodology Add-On for QPack” employs the Blackblot Product Frames model as the backbone for the product definition process and the Blackblot’s Procedural Requirements Management model as the structured methodology for crafting quality market requirements.

Developed by Orcanos, QPack provides an end-to-end solution for product lifecycle management. QPack’s main modules manage requirements, design tasks, unit tests, test planning, test execution, defect tracking, content versioning, project tracking and analysis, release management, change management, and more.

PRODUCT OVERVIEW

Crafting market requirements is arguably the most important step of the product definition process, after uncovering the market problem. Once all market requirements are complete, they form a Market Requirements Document (MRD), which represents a true commitment to customers by addressing their problem.

The add-on provides the ability to apply product management’s market requirements (which address the ‘problem space’) to QPack (which address the ‘solution space’) and create a traceable link between Product Management activities and Product Development activities.

The QPack platform is a web-based client-server application that efficiently integrates Blackblot’s models to create an extremely practical product management professional tool that is easy to learn and use, covers ALL aspects of product development lifecycle management (PLM), and is highly adaptable to meet all needs because of its customizable and flexible architecture.
