Management
Database™

Blackblot Custom Process Module

The *Requirements Management Database*™ (<http://www.reqdb.com>) is a collaboration tool to help capture, refine, prioritize, and track a detailed list of product requirements in a living document.

The *Blackblot Custom Process Module* is a free plug-in to the Requirements Management Database – providing the whole product management team with “fill in the blank” software that conforms to Blackblot’s *Procedural Requirements Management*™ (PRM) methodology.

- **Distribute the requirements across the entire project team** – with Word and Excel, only one user can ever update the requirements document – rendering it static and unwieldy. With the Requirements Management Database, multiple distributed users can simultaneously view, add, edit, and report all of the project requirements.
- **Ensure that ALL requirements are captured** – enter market and product requirements directly into the database when they arise – ensuring that they will no longer fall through the cracks, get lost in an email, or go missing whenever a team member leaves the group.
- **Create the right set of requirements for all foreseeable updates** – by balancing current and future requirements you more effectively create a detailed roadmap of releases.
- **Generate Requirement Documents Instantly** – the output reports are designed to fit directly into the Blackblot PRM Market and Product Requirements Document templates, as well as the PMTK Features Matrix.
- **Synchronize Data with other Tools** – data is automatically synchronized with the full Requirements Management Database – providing the user with additional capture, filter, and reporting functionality as well as synchronization with Microsoft Project®.

The Blackblot Custom Process Module plug-in is included as a standard component within the Requirements Management Database™ and is available for download at www.reqdb.com.
